

APEXPLANET SALES DASHBOARD

Task 3 — Deep-Dive Analysis & Interactive Dashboard

Customer Segmentation Analysis

Project	ApexPlanet Sales Analytics
Analysis Type	Customer Segmentation Deep-Dive
BI Tool	Microsoft Power BI
Dataset	Cleaned ApexPlanet Data Analytics Dataset
Records	1,000 sales transactions
Unique Customers	947

1. Introduction

The objective of this project is to transform sales transaction data into an interactive business intelligence dashboard that helps users understand overall performance and explore customer value. The analysis combines KPI reporting with a focused customer segmentation deep dive.

2. Business Objective

The dashboard is designed to answer practical business questions: How much revenue is being generated? How many orders and customers are involved? Which categories, products and cities contribute most to sales? Which customer segments generate the greatest revenue, and where are those customers concentrated?

3. Dataset Overview

Attribute	Description
Records	1,000 transaction records
Customers	947 unique customer IDs
Date	Order date / monthly sales trend
Product information	Product and category
Customer information	Customer ID, city and gender
Sales information	Quantity, unit price and total sales

4. Core KPIs

Five KPIs were selected to provide a compact view of business performance.

KPI	Formula / Calculation	Business Rationale
Total Revenue	SUM(Total Sales)	Measures overall sales generated.
Total Orders	COUNT of transactions / orders	Measures transaction volume.
Total Customers	DISTINCTCOUNT(Customer ID)	Measures the customer base.
Average Order Value	Total Revenue ÷ Total Orders	Measures average revenue per order.
Average Unit Price	AVERAGE(Unit Price)	Measures average selling price.

Dashboard KPI snapshot: Total Revenue = 139.40M; Total Orders = 1K; Total Customers = 947; Average Order Value = 139.40K; Average Unit Price = 25.49K.

5. Deep-Dive Analysis — Customer Segmentation

Customer segmentation was selected as the deep-dive area because it allows the business to compare revenue contribution and customer concentration across different value groups. The dashboard uses three customer-value segments: High Value, Medium Value and Low Value.

Segmentation Approach

The Customer Segment field is used throughout the second dashboard page. The segments are compared using total sales and customer counts, and then broken down by category and city. This enables interactive exploration of where customer value is being generated.

Deep-Dive Questions

- What proportion of revenue comes from each customer segment?
- How large is each segment in terms of customer count?
- Which product categories generate the most revenue within each segment?

- Which cities have the strongest revenue contribution from High Value customers?
- How can the business use these insights to prioritize retention and growth actions?

6. Dashboard Design

Page 1 — ApexPlanet Sales Dashboard: provides the overall business view using KPI cards, category performance, top products, city sales, gender distribution, monthly revenue trends, a revenue treemap and interactive slicers.

Page 2 — Customer Segmentation Analysis: focuses on the deep dive using revenue by segment, customer count by segment, category-by-segment analysis, city-by-segment analysis and a Customer Segment slicer.

9. Key Findings

- High Value customers generate the largest revenue share: 78.44M, representing 56.27% of total sales.
- Medium Value customers contribute 39.65M, representing 28.44% of total sales.
- Low Value customers contribute 21.32M, representing 15.29% of total sales.
- Customer concentration differs from revenue concentration: Low Value customers form the largest customer group at 46.2% (462 customers), while High Value customers represent 26.1% (261 customers) but generate 56.27% of revenue.
- Electronics has the highest total revenue among the displayed categories, with a substantial High Value contribution.
- The city-level analysis enables comparison of High, Medium and Low Value revenue across Patna, Kolkata, Bengaluru, Mumbai, Hyderabad, Delhi, Pune and Gaya.

10. Business Recommendations

Recommendation	Action
Protect High Value Customers	Prioritize retention campaigns, loyalty benefits and personalized offers because High Value customers contribute the majority of revenue.
Upgrade Medium Value Customers	Use targeted bundles, cross-selling and incentives to encourage Medium Value customers to move toward the High Value segment.
Increase Low Value Customer Value	Study low-value purchase patterns and test promotions or recommendations that can increase order value and repeat purchases.
Prioritize High-Value Categories	Identify categories with strong High Value contributions and focus inventory, promotions and cross-selling around those categories.
Use City-Level Targeting	Compare segment revenue by city to identify locations where High Value customers are concentrated and where targeted campaigns may have the greatest impact.
Monitor Segments Regularly	Refresh the dashboard periodically so management can track changes in customer value and evaluate whether marketing actions improve segment movement.

11. Tools & Technologies

- Microsoft Power BI
- Microsoft Excel
- DAX
- GitHub

12. Deliverables

- Interactive Power BI dashboard (.pbix) with two pages.
- Customer Segmentation deep-dive analysis.
- Deep-dive report for GitHub.
- Dashboard screenshots for project documentation.
- Live Power BI dashboard link to be added after publishing.
- 5–7 minute LinkedIn demonstration video.

13. Conclusion

The ApexPlanet Sales Dashboard converts transaction-level sales data into an interactive business intelligence solution. The first page provides a clear overview of sales performance, while the second page performs a customer segmentation deep dive. The analysis shows that High Value customers contribute a disproportionately large share of revenue compared with their customer count. These insights can help the business prioritize customer retention, targeted promotions, category strategy and city-level marketing.
